ABSTRACT

The Eastern part of the city of Udine is a great example of experimentation for the urban regeneration of an existing architectural heritage, the historical buildings of the disused military complex in the Friuli region.

The transformation and requalification project aims to recognize the social and environmental context, highlighting the critical points and weaknesses, in order to put into effect the possible solutions with a multi-disciplinary approach, and to realize an appropriate planning for the re-use and implementation of innovative technologies.

The project “Experimental city beyond the living boundaries – an opportunity of urban re generation for the Eastern area of Udine” will be introduced herewith. The project has been developed by the local government of Udine, with the cooperation of Udine University for the research and project activities – Space Lab (Polytechnic Department of Engineering and Architecture), for the development of the “Extraordinary plan for the urban requalification and safety at the suburbs of the metropolitan cities and of the county towns”.

The architecture in the urban regeneration is a dialogue between the existing and new buildings, becoming an ideological *fil rouge* between conservation and reconfiguration of an abandoned and deteriorating area.
