### **Abstract**

Due to its location along the river, the Ducal Palace of Colorno has been affected over the centuries by significant floods. The most recent in 2017 – another one few years earlier – caused very serious damage and an emergency solution was adopted to completely close the arches of the Bibienesque arcade, already partially buffered in the mid-nineteenth century. Obviously, the solution to the problem cannot depend solely on measures taken in an emergency, or on the criteria adopted for the restoration of the walls invested by water, but it certainly requires environmental and hydraulic measures, such as the realization of overflow basins to regulate the flooding of the river near the monumental complex of the Palace and the entire urban center of Colorno. The care of the territory is the real contemporary challenge.
